DATA VISUALIZATION FOR DECISION MAKING

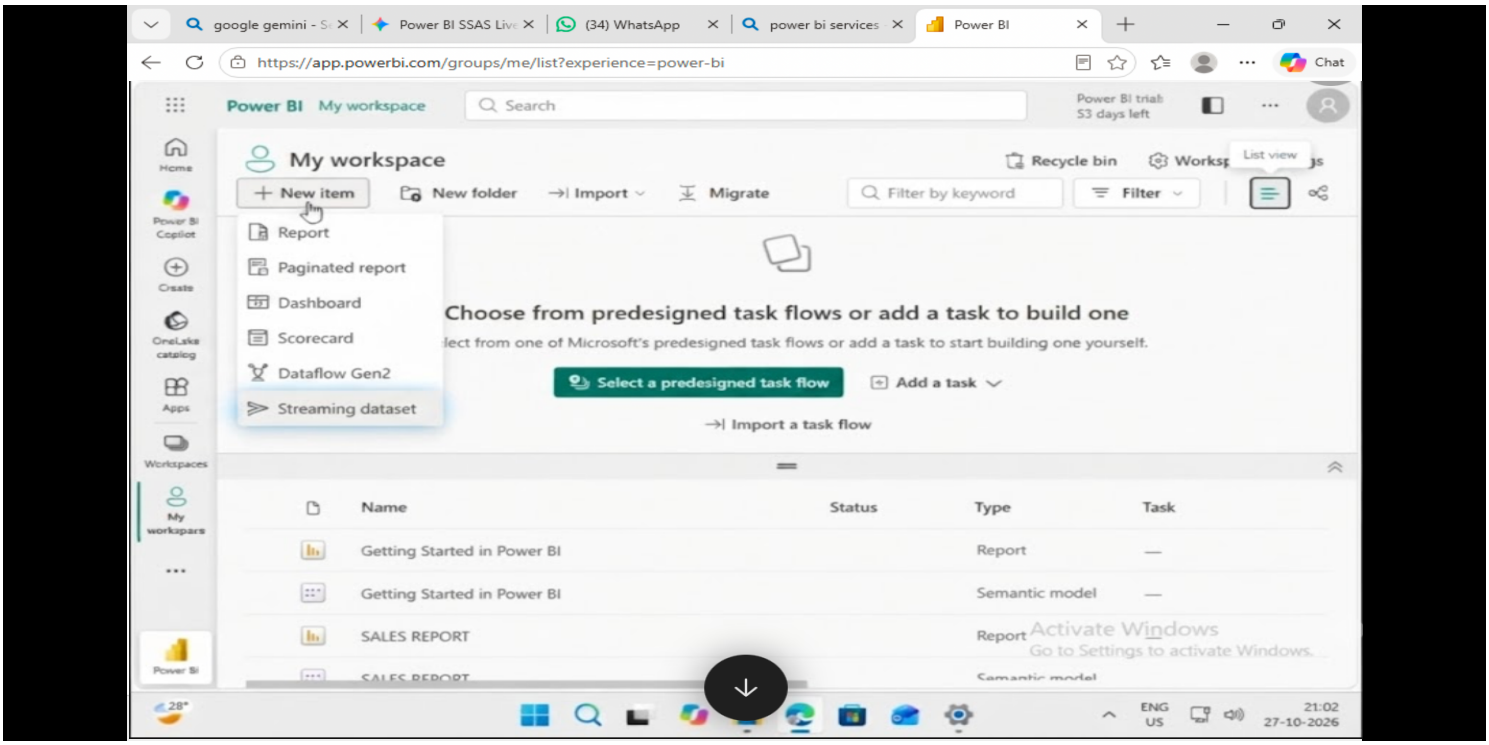

Practical 14: Real-Time Dashboard

Student Name: Jeel Patel	**Enrollment No.** T26084801021/26084801012
Course: M. Sc. IT (Data Science)	**Semester:** 1 I **Course Code:** P91A3DVD
Academic Year 2026-27	**Practical:** Real-Time Dashboard

Objective: Publish streaming data and create a real-time dashboard in Power BI Service using API push endpoints and dynamic visual tiles.

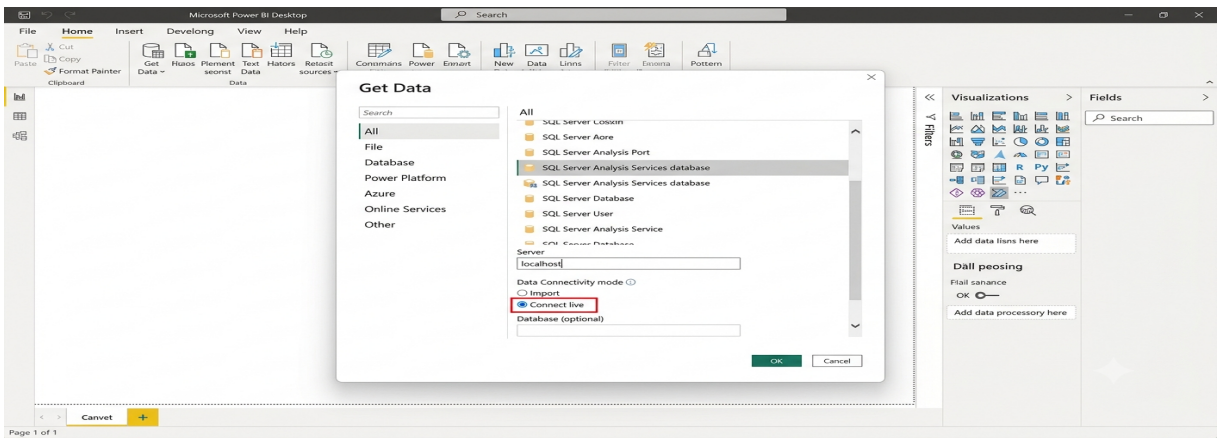

Step 1: Open Power BI Workspace & Click New Item

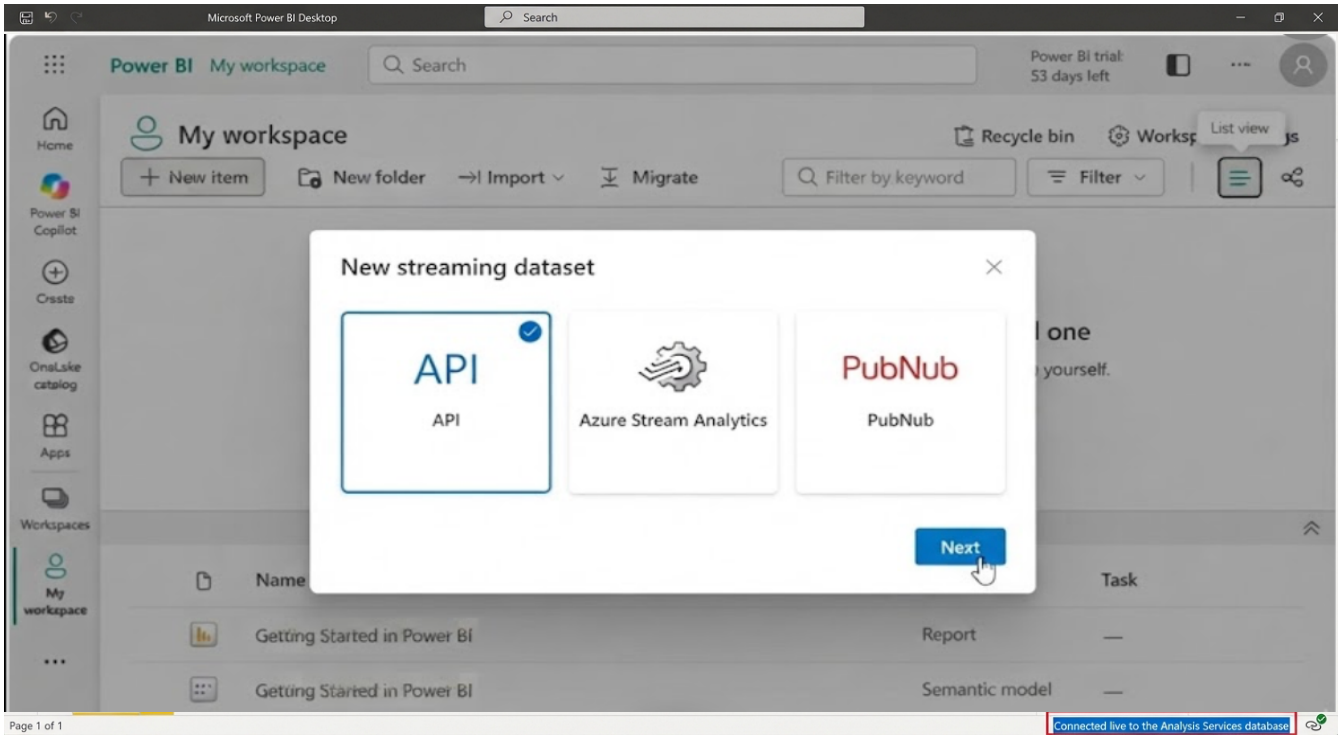

Log in to Power BI Service and navigate to your workspace. Click the **+ New item** button at the top toolbar.

Step 2: Select Streaming Dataset from Menu

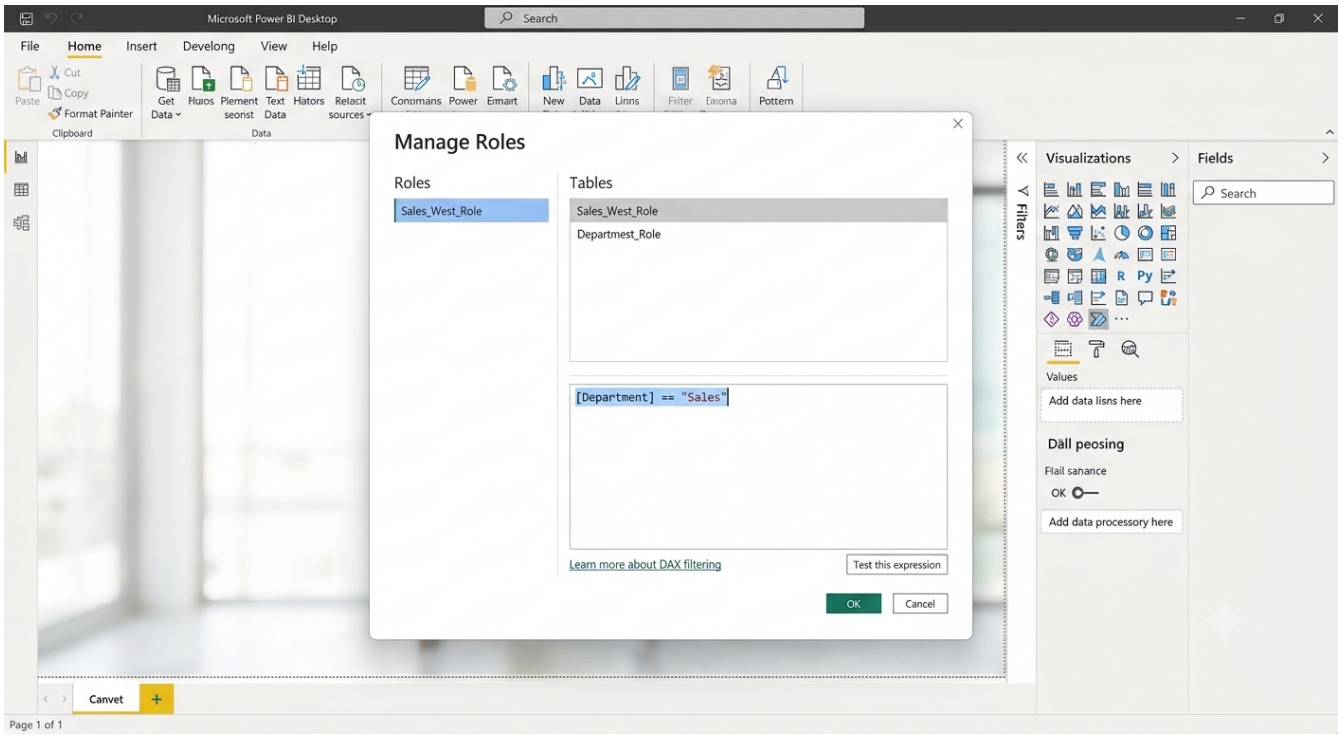

From the dropdown menu that appears under New item, click on **Streaming dataset**

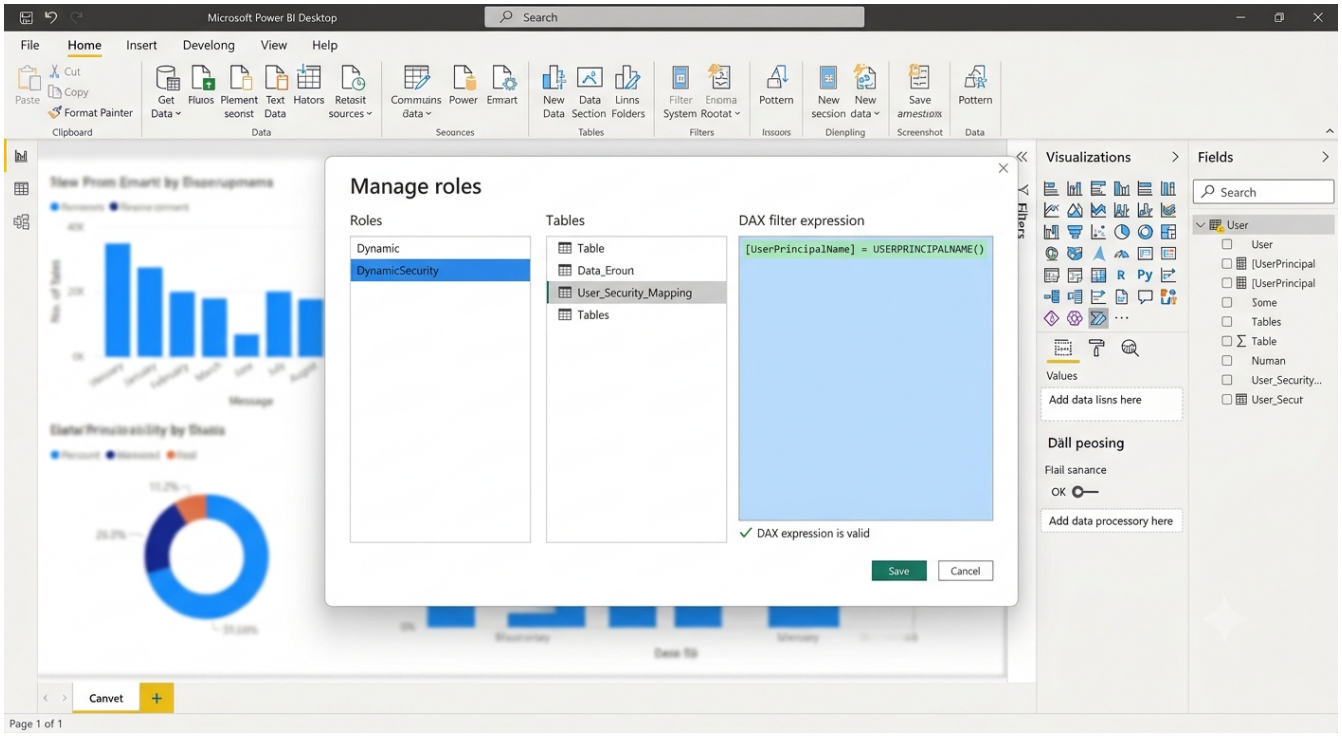

Step 3: Choose API Source Type

Select **API** as the source type for streaming data payloads pushed via HTTP POST requests and click Next.

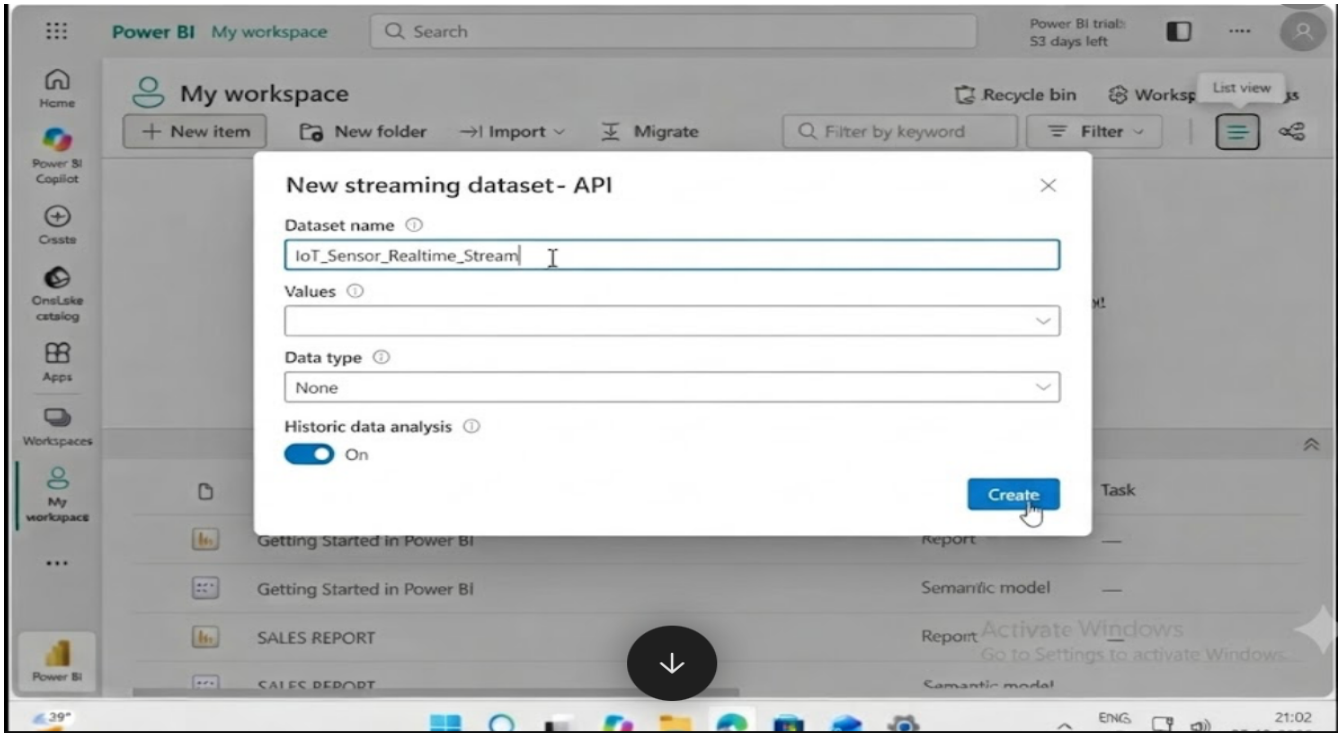

Step 4: Configure Dataset Name & Schema

Enter the dataset name IoT_Sensor_Realtime_Stream, define values/datatypes, and enable historic data analysis.

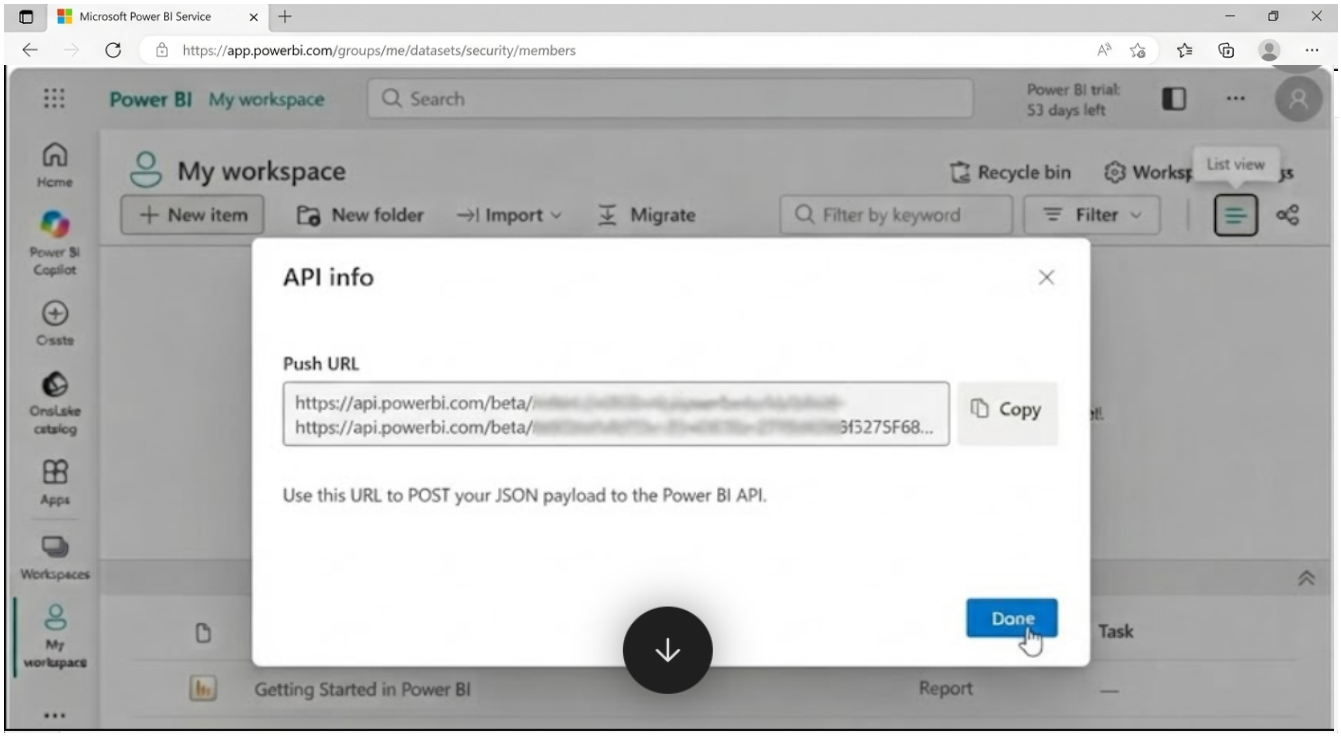

Step 5 & 6: Create Dataset & Copy Push URL

Click **Create** to generate the REST API endpoint and copy the auto-generated **Push URL**

Step 7: Final Real-Time Dashboard Monitoring View

Add streaming visual tiles (Line Chart, Card) to the Power BI dashboard to render live telemetry data instantly.

Result

A real-time streaming dataset was successfully configured in Power BI Service using API endpoints. Live metric payloads were streamed via HTTP POST requests and rendered dynamically on a real-time operational dashboard with zero-latency visual updates, fulfilling all requirements for real-time monitoring.
