DATA VISUALIZATION FOR DECISION MAKING

PRACTICAL REPORT

Student Name: Jeel Patel

Enrollment No.: T26084801021/26084801012

Course: M. SC.IT (Data Science)

Semester: 1

Course Code: P91A3DVD

Academic Year: 2026–27

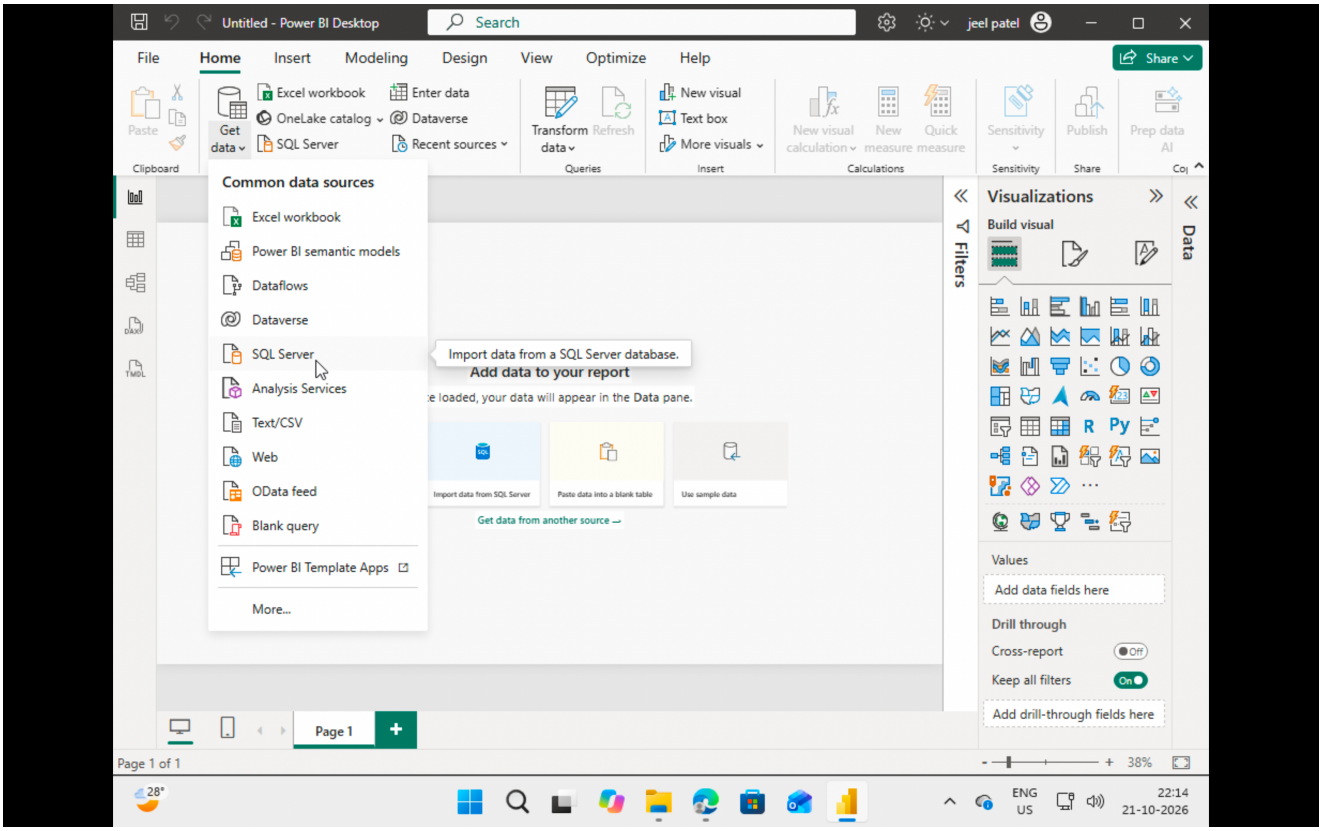

Practical 6: Database Connectivity

Practical 6: Database Connectivity

Step 1: Open Power BI and Select Get Data

• Open Power BI Desktop and select **Home > Get Data**

• Choose **SQL Server**from the available data sources.

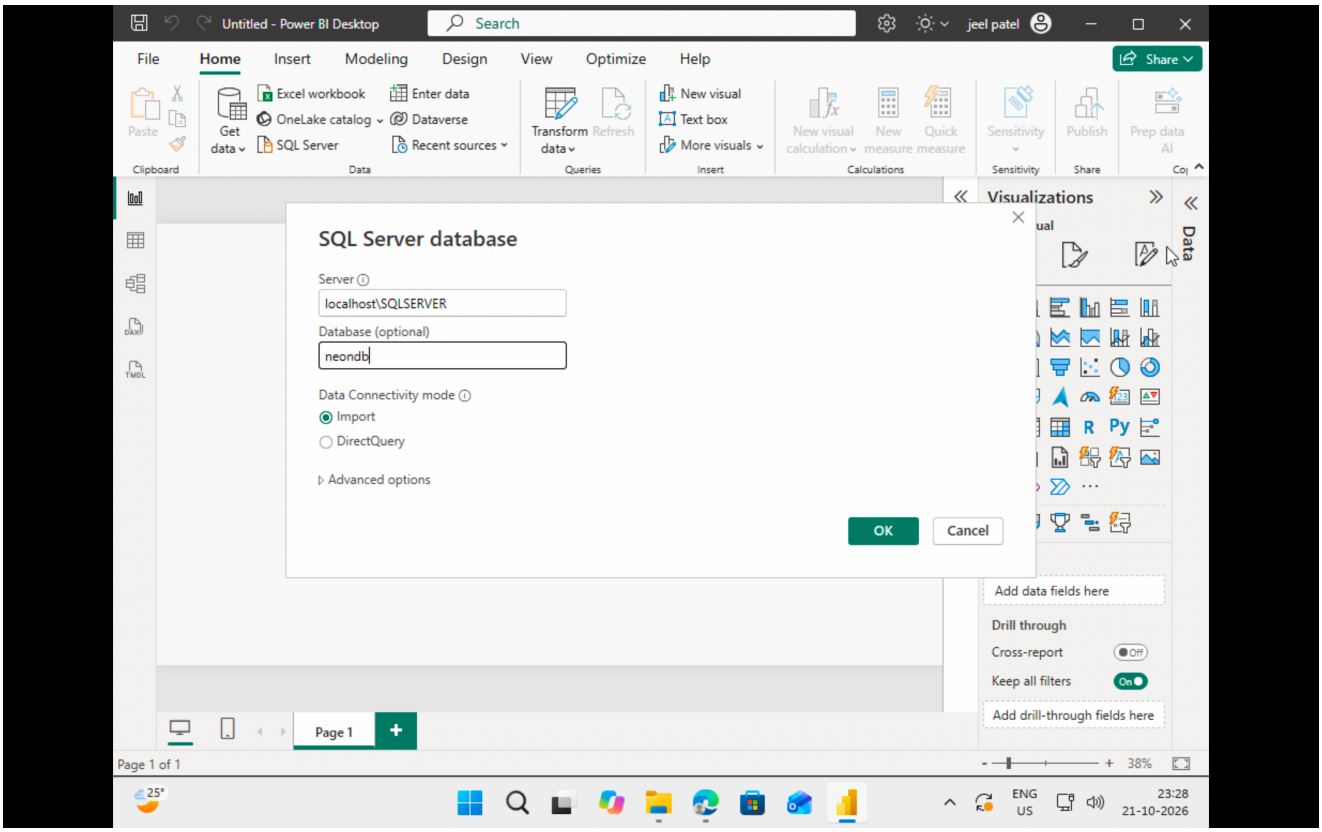

Practical 6: Database Connectivity

Step 2: Enter SQL Server Connection Details

• Enter the SQL Server name in the **Server** field.

• Optionally enter the database name. Choose **Import** for loading a copy of the data, or **DirectQuery** when appropriate.

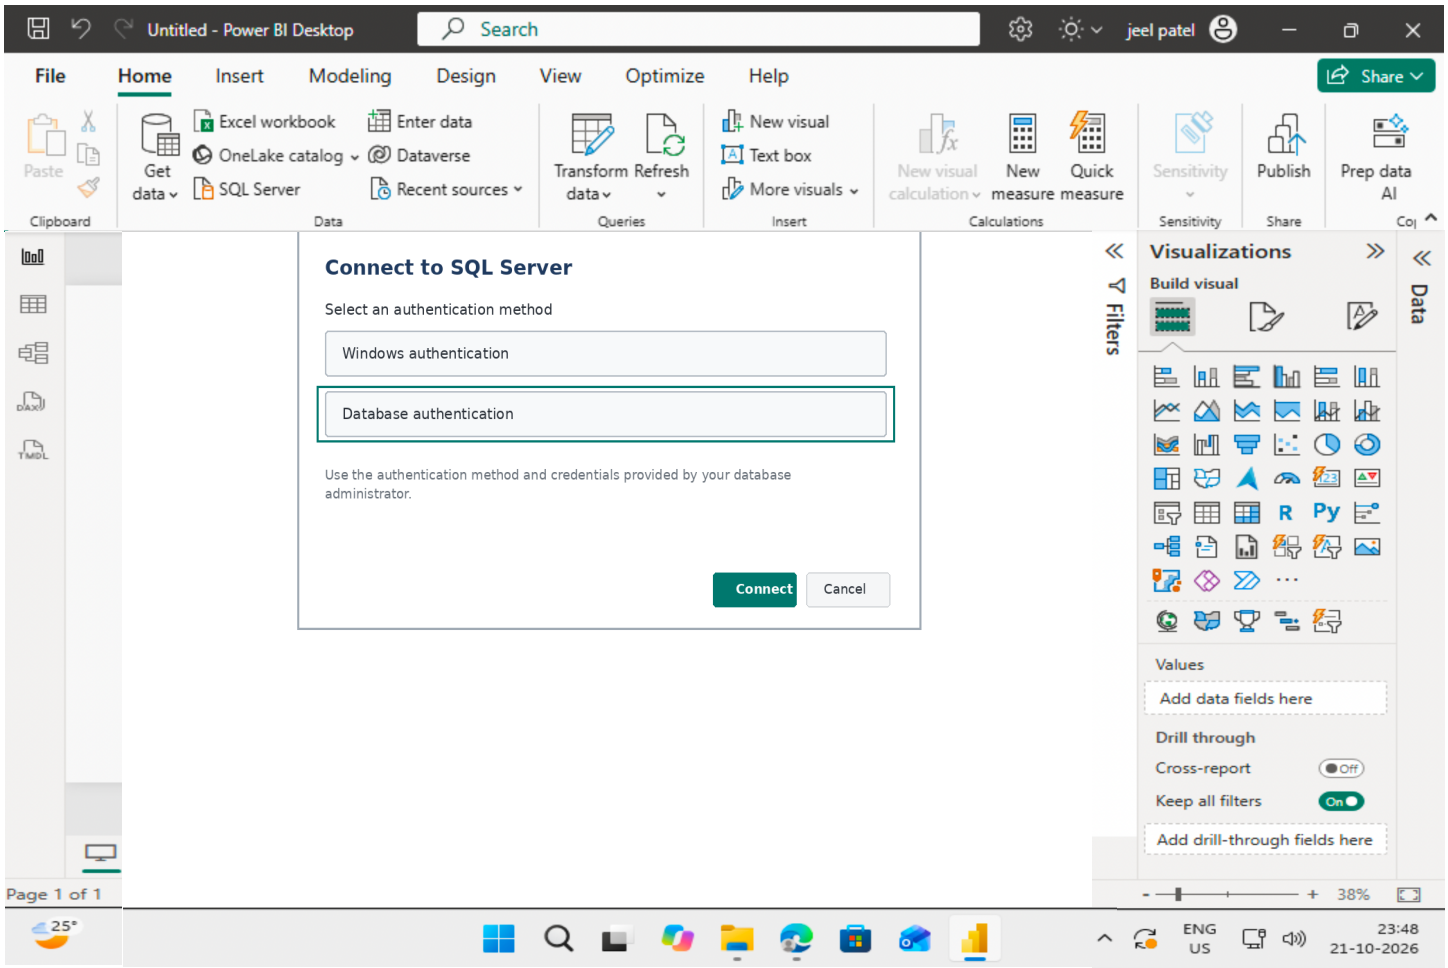

Practical 6: Database Connectivity

Step 3: Authenticate the Connection

• Choose the authentication method approved for your SQL Server, such as Windows or Database authentication.

• Enter credentials if prompted, then select **Connect** Use only authorized database credentials.

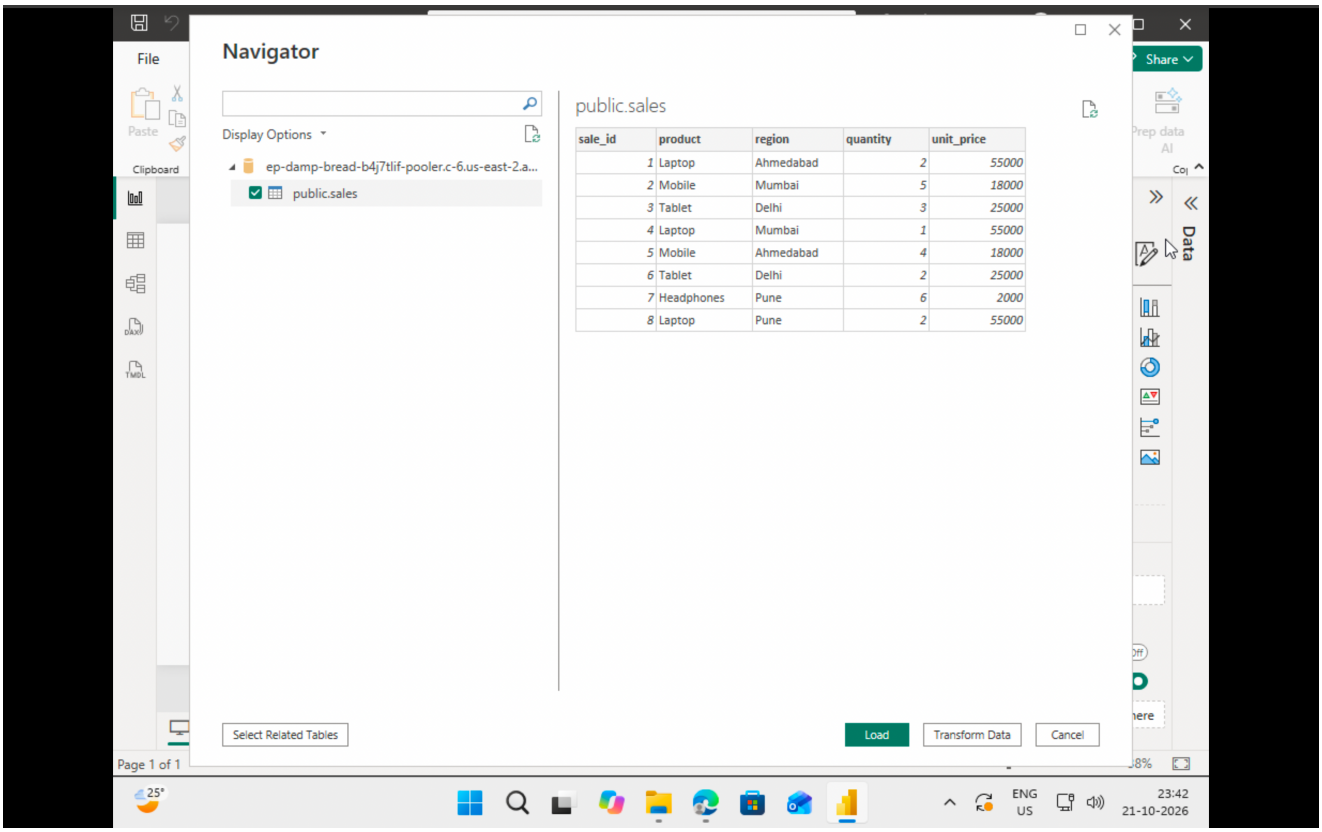

Practical 6: Database Connectivity

Step 4: Select Tables in Navigator

• After the connection succeeds, the Navigator window lists available databases, tables, and views.

• Select the required tables and review the preview. Select **Load** to import immediately, or **Transform Data** to clean the data first.

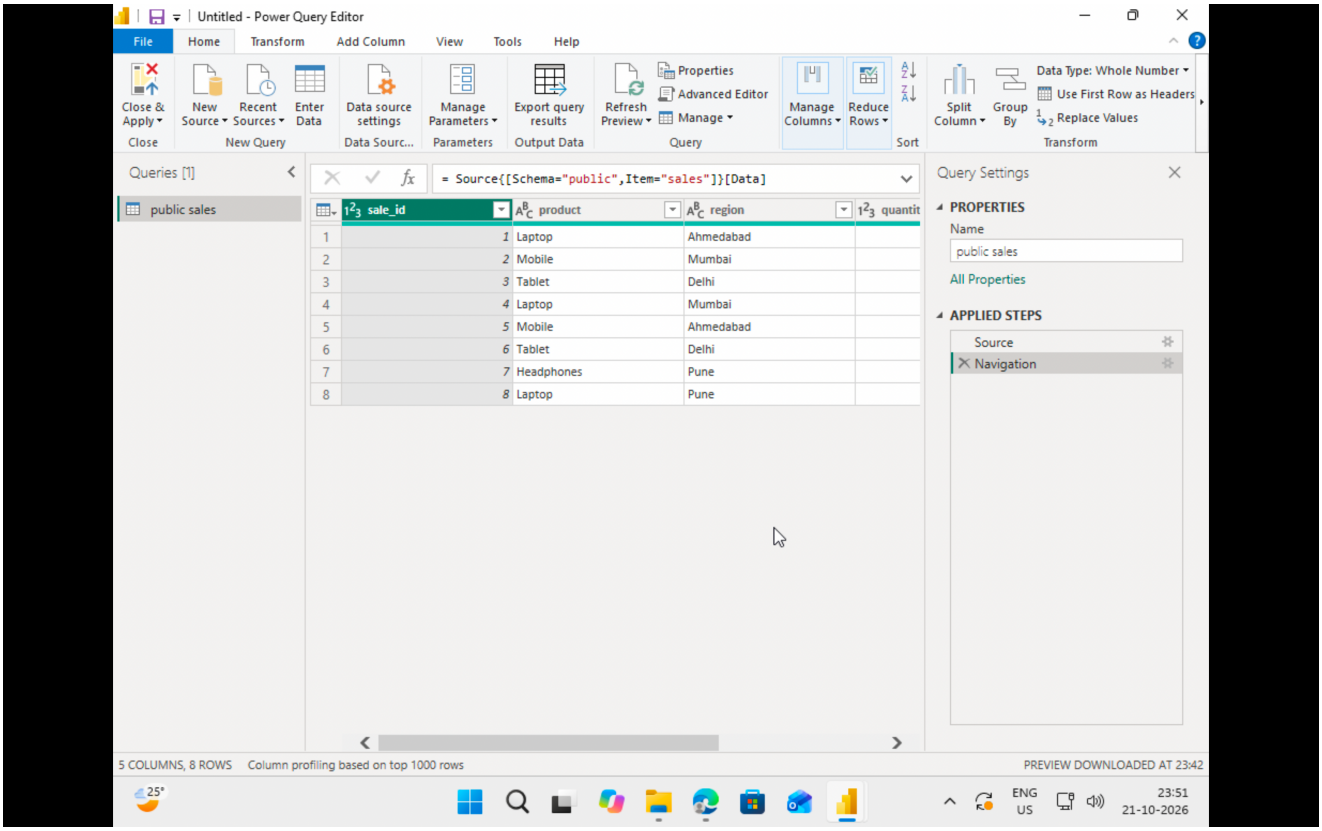

Practical 6: Database Connectivity

Step 5: Review Data in Power Query (Optional)

• If you selected **Transform Data**, Power Query Editor opens.

• Review column names and data types. Apply any required changes, then choose **Home > Close & Apply**

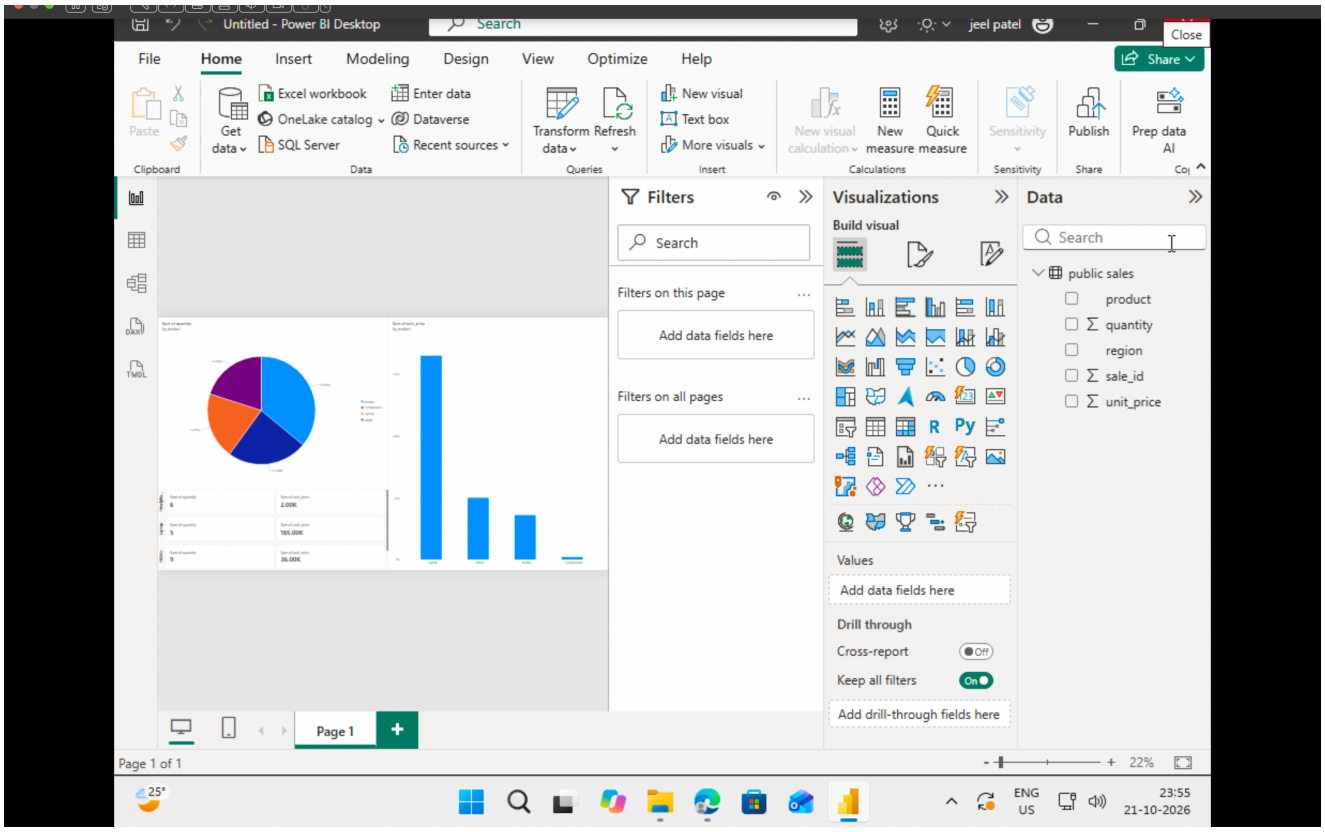

Practical 6: Database Connectivity

Step 8: Create a Basic Visualization

• Open **Report view**and select a suitable visual, such as a bar chart, column chart, or table.

• Drag the required fields into the visual and confirm that it displays the connected data correctly.

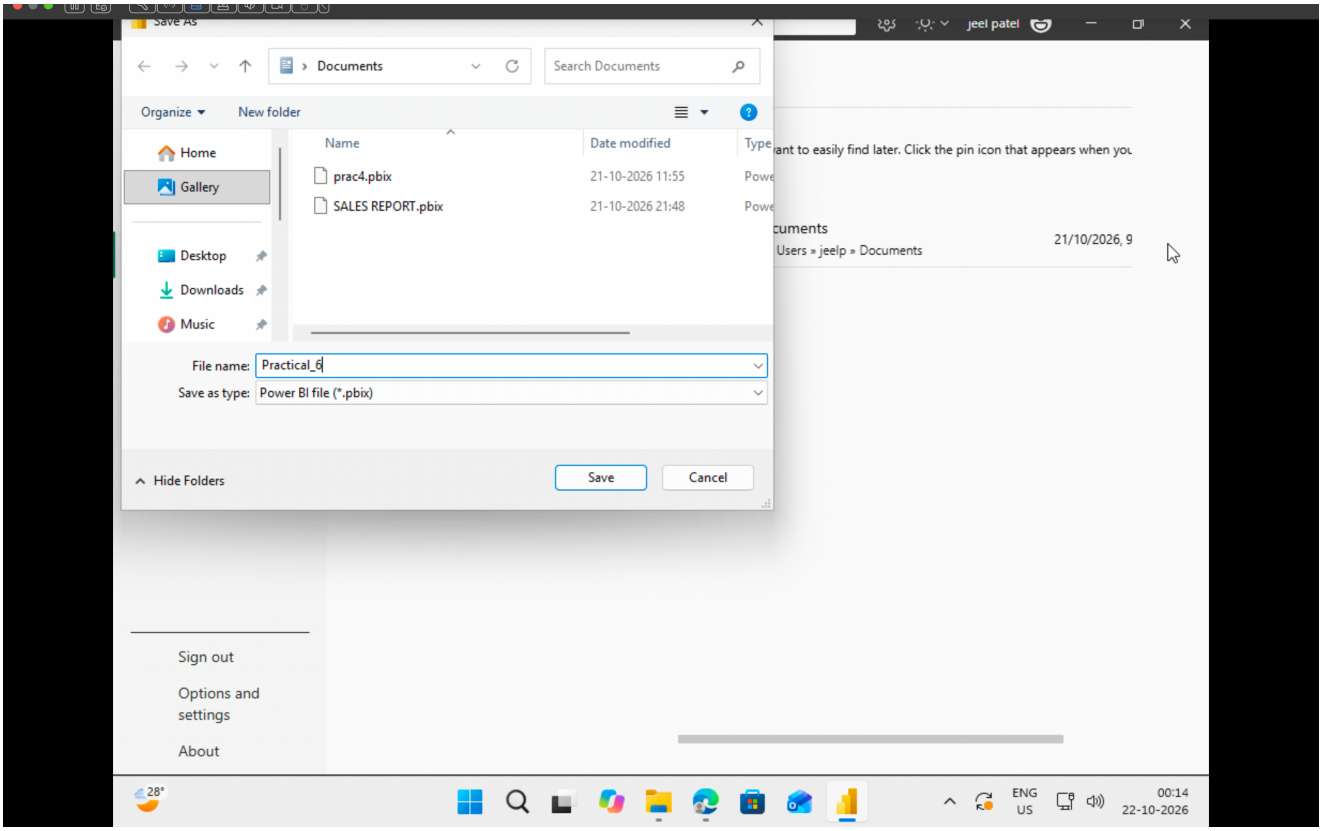

Practical 6: Database Connectivity

Step 9: Save the Power BI File

• Select **File > Save As**

• Save the report as **Practical_6_Database_Connectivity.pbix** in the required folder.

Practical 6: Database Connectivity

Result

Power BI Desktop was connected to a SQL Server database, and selected tables were loaded for analysis. The data was checked, table relationships were reviewed, and a basic visualization was prepared. The connection details and tables shown in the illustrations are examples; use the actual server, database, credentials, and tables available in your lab.
